

Question:

You are given an **Excel dataset** containing daily sales data of a retail store with the following columns:

Date	Product	Sales_Amount	Region
------	---------	--------------	--------

During initial analysis, you observe:

- Some rows have **blank Sales_Amount**
 - Few Sales_Amount values are **extremely high compared to others**
 - Management wants a **single summary metric** to represent *typical daily sales* for **Region = "South"** only
-

Questions:

a) Which statistical measure would you choose — **Mean, Median, or Mode** — to represent *typical daily sales* and **why**?

b) Write an **Excel formula** to calculate this metric **only for Region = "South"**, ignoring blank sales values.

c) If management still insists on using **Average**, how would you **modify the Excel formula** to reduce the impact of extreme values **without removing rows**?

Dataset

Date	Product	Sales_Amount	Region
01-01-2026	Laptop	25000	South
02-01-2026	Mobile	18000	South
03-01-2026	Headphones		South
04-01-2026	Laptop	300000	South
05-01-2026	Keyboard	4500	North
06-01-2026	Mouse	5200	South
07-01-2026	Mobile	19000	East
08-01-2026	Laptop	26000	South
09-01-2026	Charger		West
10-01-2026	Tablet	24000	South
